# Module 1: Crash Prevention <br> Lesson 2: Stopping Distance and Crash Avoidance Laboratory Exercise <br> <br> Grade 9-12 

 <br> <br> Grade 9-12}

## Learning Objective

When you learn to drive you may learn the " 3 second rule" that suggests you should leave about three seconds of time between you and the next vehicle. To accomplish this, pick a fixed object like a road sign, and count three seconds between when the car in front of you passes it and when you do.

- Why do you think the " 3 second rule" is important?
- If you are traveling at a high rate of speed or if the roads are wet would the 3 second rule change?

We can determine why the 3 second rule is important by using some math.

## Procedure

Step 1: Data Collection

## Option A: View of highway

If you have view of the highway, calculate the speed of 5 vehicles as they pass a preset starting and ending point. In order to calculate speed, use the following formula: Speed, V= distance /time.

Record your times and velocities below:

| Vehicle | $\mathbf{1}$ | $\mathbf{2}$ | $\mathbf{3}$ | 4 | 5 |
| :---: | :--- | :--- | :--- | :--- | :--- |
| Time (s) |  |  |  |  |  |
| Speed <br> (m/s) |  |  |  |  |  |

Option B: No view
If you do not have a view of the highway (or want to skip Step 1) use preset speeds.

| Vehicle | $\mathbf{1}$ | $\mathbf{2}$ | $\mathbf{3}$ | $\mathbf{4}$ | $\mathbf{5}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| speed <br> (m/s) | 15.6 | 20.1 | 24.6 | 29.1 | 33.5 |
| speed <br> (mph) | 35 | 45 | 55 | 65 | 75 |
| 1 |  |  |  |  |  |

## Step 2: Distance traveled during braking (d)

The link is a YouTube video that explains the formula we will be using. https://www.youtube.com/watch?v=oLPgNkuzw8M

Distance while braking is calculated using the following formula:

$$
d=\frac{v_{0}^{2}}{2 \mu g}
$$

Where:
$d=$ distance ( m )
$v_{0}=$ initial speed $\left(\frac{m}{s}\right)$
$\mu=$ coefficient of friction (between tire and asphalt) (no units)
$g=9.81 \frac{\mathrm{~m}}{\mathrm{~s}^{2}}$ (the acceleration due to gravity)
The value of $\mu$ on dry asphalt is about 0.95 . The value of $\mu$ on wet asphalt is about 0.80

So using the formula above, determine the value of $d$ for the 5 vehicles you are testing and record your data in the table.

| Vehicle | $\mathbf{1}$ | $\mathbf{2}$ | $\mathbf{3}$ | $\mathbf{4}$ | $\mathbf{5}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Distance during <br> braking |  |  |  |  |  |

Step 3: Distance traveled during driver's perception (dr)
You also have to account for the time it took for the driver to react ( $\mathbf{d}_{r}$ )

Use the following formula:

$$
d_{r}=v * t
$$

Where:
$d_{r}=$ distance traveled during perception
$v=$ speed ( $\mathrm{m} / \mathrm{s}$ )
$t=$ time to perceive and react to the need to stop, in seconds*
(*The value of $t$ has been determined by experts in the field to be about 1.5 seconds)

So using the formula above, determine the value of $d_{r}$.

| Vehicle | $\mathbf{1}$ | $\mathbf{2}$ | 3 | 4 | 5 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Distance during <br> perception |  |  |  |  |  |

## Step 4: Total stopping distance (ds)

To determine the total safe stopping distance, you must combine the stopping distance with the distance traveled during perception.

Use the following formula:

$$
d_{s}=d_{r}+d
$$

Where:
$d_{s}=$ total safe stopping distance
$d_{r}=$ distance traveled during perception
$d=$ stopping distance

| Vehicle | $\mathbf{1}$ | $\mathbf{2}$ | $\mathbf{3}$ | $\mathbf{4}$ | $\mathbf{5}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Total stopping <br> distance |  |  |  |  |  |

## Step 5: Graph your results

Plot your data for total stopping distance vs speed using a line graph.

## Lab Report

Your lab report should contain the following sections:

1. Introduction and Hypothesis
2. Calculations
3. Results
4. Discussion
5. Conclusions

## Questions

Answer these questions in paragraph form within your lab report.

1. What happened to the total stopping distance as speed increased?
2. Considering, the distance it takes to stop a vehicle, why is the " 3 second rule" important?
3. How does a vehicle's size (dimensions and/or mass) affect its ability to stop? Is this incorporated into our equations? Why or why not?
4. Imagine 2 cars were following each other had to stop suddenly. How would our formula for total stopping distance be altered if the 2 cars had connected vehicle technology that allowed the 2 cars to communicate with each other, the moment they braked, and to warn the driver of the braking?
5. What effects would in-vehicle technologies have on crash prevention? Explain.
6. How would these technologies affect the " 3 second rule"?
